

CM 1005 FINALS COMMENTARY

The CM 1005 Coursera has taught me a lot of things on JavaScript and coding in general. However, there were many concepts that I have had a hard time learning and being efficient in using without any external help. One of the skills that I had trouble is with understanding loops and arrays. I had to ask my friends and the lecturer to get a grip on the basic idea of loops and arrays. To be more well versed with these functions and topics I had to do the worksheet provided by my lecturer and checked it with my friends if I was correct or wrong.

The extensions I have added to my game are sounds, platforms and enemies. I have used functions such as preload and loadSound to enable sounds to be played when certain actions are done in the game. Enemies pose a threat to the game character as it removes one of the three lives available.

A bug I encountered in my game was when my character got in contact with an enemy caused an instant game over instead of the lives going down. I had to comment out some of my enemy code as well as my game over code to figure out what was causing the issue. However, it had nothing to do with most of the code I commented out and I had to add new lines of code to implement the lives going down when hit by the enemy.

The skills I have learnt are using image input. I got this skill by doing certain sleuth cases where image input was used. I have also learnt to be more efficient when it comes to debugging as I have learnt to test the code by commenting one line at a time rather than multiple lines to ensure that I do not get lost while working with my project,
